Section XI.

Hydrographic Sheets Nos. 1, 2 & 3.

~~Willapa~~ Bay, Wash.

Coast Survey Steam Yacht,

St. J.M. Helm, U.S.A. Comdg.

1890.

The Shuts are respectively Shut 1, 2 and 3, of 1890, <sup>Willapa</sup> ~~Shuttleworth~~  
Bay, Washington. Statistics are appended to this report, on  
Form II, Statistics of Field Work.

Attention is called to several points on the various Shuts as  
follows, Shut No. 1:-

To the wharf cut in at North Cove.

To the limits shown of Indian village of Georgetown.

To the fact that the life saving station has been moved from the  
old charted position across a slough to where now shown at our  
signal flag.

The shore line was run in on the point to the S.E. of North  
Cove around by signals Mizard, Net and slack, curving up the  
beach towards signal Ridge.

Shore line of an island where our signal Boat was built  
was run in, also of an island on which was old triangula-  
tion point Dog.

Crescent Island and a small island to the westward of it, near  
Leadbetter Point, have disappeared.

The wreck used as a signal by McArthur's party in 1887 has  
disappeared.

Shut No. 2:-

To the several wharves cut in at Bay Centre, Palux River; and  
on the Willapa River at Sea Haven, South Bend Mill,

South Bend, Dash Mill above South Bend, and at the proposed site of North Pacific City, where our signals Rest and Pile are.

To the stakes along Willapa, North and Palux River channels, and to the pile at signal Pole.

Along the Willapa River the shore line has been run in from signal Swamp to the end of the Survey past signal Road on the left bank, and from near signal Dew to signal Cliff on the right bank.

To the log boom of piles below signal Ridge in Willapa River.

To the investigation of the shore line of Mailboat Slough, from signal Star to signal Fish, and of the branches of this slough.

Sheet No. 3:

To wharves cut in at proposed site of Stanley (on which is our signal Hen), at Sunshin (on which is signal Saw), and at Sealand (on which is signal Sea).

To the fact that the wharf at Oysterville has been destroyed, and isolated house now stands on piles where end of wharf formerly was and on this house our signal Jag was built.

To log boom of piles extending from upper end of wharf at Sunshin along bank of Cada River.

To the shore line of Cada River run in from below signal Hull to signal Dub on the right bank and on the left bank from signal Hen to signal Drift

The locality of the survey was on ~~Shoalwater~~<sup>Tillapa</sup> Bay in southwestern Washington. It is a large bay with narrow channels between many shoals and mud flats which are mostly exposed at low water. There is a bar across its mouth extending some distance off shore and the bay is entered by two channels known respectively as the North and South Channels.

Several small streams empty into the bay, the most important being the Willapa, Nasel, Palux and North Rivers.

For vessels of 10 ft. draught the Willapa River is navigable at high water as far as Willapa City miles from its mouth, the Nasel at high water for six or seven miles above Dungeness, North River at high water as far as the cannery and the Palux River at high water as far as Bay Center. Small tugs at high water sometimes enter some other streams to tow out logs.

The shores near the entrance to the bay, and on the peninsula inside, are low and sandy with low wooded hills behind them; on other parts of the bay low wooded bluffs come close down to the water's edge and are faced by large areas of sand and mud flats bare at low water.

The banks of the Willapa River are low and marshy, partially dyked, but said to overflow at winter tides as far as South Bend on one bank and Segual Cliff on the other where the high land begins to come close down to the river.

2.

Vessels engaged in the carrying trade consisted at the time of our stay of a steamer, the General Miles, running from Portland, Ore., via Astoria, to various points on the bay about every five days, but the regularity of her trips was dependent in a great measure on the condition of the Columbia River and <sup>Willapa</sup> Shoalwater Bay bars at certain seasons. Of sailing craft as many as six different brigantines and schooners visited the saw mills on the bay during last summer for lumber cargoes. These vessels ply steadily generally between San Francisco and the bay and each of the two mills will average three vessels loaded and despatched per month. The General Miles and the sailing vessels bring in small cargoes of general merchandise and the Miles on return trips in fall and winter carries out large quantities of oysters.

3.

The coast presents a low and very indistinct aspect on approaching from seaward. To the N.E. of Cape Shoalwater are low hills back of the beach. On approaching from seaward Cape Shoalwater Light House will, in good weather, probably be the first definite landmark made; in hazy, smoky or foggy weather a vessel approaching from seaward would be on the shoals, in the breakers and on dangerous ground before any land would be made. Heavy breakers on the middle sands

## 3.

and the North spit will ordinarily be seen and the buoy at the entrance to the South channel would probably be the first landmark found. A whistling buoy, well off shore, is very much needed. The lead should be freely used whenever in this vicinity. Ranges are known to the local pilots but are subject to frequent changes to suit the changes in the channels.

In the South channel the pilots usually run by the buoys unless they have found them to be out. The light house is often used to give an approximate course till the buoys can be picked up. No. 4 buoy, of the South channel, a little open with Dote Point is a general range for the North channel, but when navigating this channel pilots generally watch the breakers on either hand, the swell on the bar and avoid bad looking spots.

In ordinary weather the swell in the North channel is either ahead or astern and this channel is often used on this account, since in the South channel a vessel is exposed to a swell abeam and with a strong flood tide rushing over the banks will roll heavily even in good weather.

In moderate or slightly bad weather the North channel is often breaking when the South channel can be freely used.

The only light house is the Cape Shallowater light house, a low white structure, bearing a light of the fourth order, and situated to the northward of the interior of the

3.

bay and  $6\frac{1}{2}$  miles to the std. of the bar buoy in the South channel.

4.

The least and greatest channel depths can best be taken off the chart after the soundings have been fully plotted.

Dangers near the channels are the middle sands between the two channels, a long spit extending out to the std., of the North channel, and shoals making out from Leadbetter Point towards the South channel. Inside the bay are numerous shoals extending out from the shores and also isolated shoals, all of which will be shown when the survey is completed.

In the North channel there are no buoys and its passage should not be attempted without a pilot or local knowledge.

With a chart corrected to date for location of dangers and buoys a pilot might not be necessary for the South channel in good weather; here the deepest water is found near the middle sands whose banks are steep and dangerous and usually defined by breakers, but the water in the channel is often much agitated by the strong flood tide and a stranger might easily be confused. This channel is further narrowed about buoy No. 1 by shoals making out from Leadbetter Point. Sometimes the bar breaks heavily even when it is not blowing hard near the land and in

Such a case a stranger should not attempt to cross without a pilot. The captain of the tug which usually lies in North Cove, unless towing in the bay, is a pilot and will go to a vessel making a signal. Once inside the bay the channels at low water are well defined, a vessel should go to North Cove or South Bend in ordinary weather without trouble at any time, using aids to navigation & chart. Down the bay, towards the Santa Rita River, the buoys are further apart and unless the weather is clear enough for them to be seen the navigator must depend on correctness of the buoys, time and the compass.

The channel of North River is too narrow to be navigated by chart, vessels have to run by the piles bearing red and black targets which are numerous on either bank. The Patux River channel is very narrow and difficult to follow, it has a buoy (No. 1) at the entrance and four piles at intervals on the Southern side, but there are no targets on these piles. The Wil-lapa and Nasar Rivers can be navigated from the chart when finished without trouble as far as the survey extends.

If you want a pilot or tug show your flag and the tug lying in North Cove will be signalled from the light house by the life saving boatman who patrols the beach near there. This is the only sea-going tow boat on the bay, a boat from Gray's Harbor sometimes tows her also. Pilot fees are not com-

4.

sparsely and there are not any harbor regulations.

5.

The channels are subject to frequent and sudden changes. Changes are found on the bar, on both sides of the entrance to the harbor, and inside the bay to the st'd. of the mouth of the Patux River. The channels do cross shifting bars. The character of the bottom is usually hard sand in the channels, in the river and in the bay near river mouths it is mud.

For tugs and small steamers the best anchorage near the entrance of the bay is in North Cove, it is impracticable for sailing vessels. In the northern part of the bay vessels will find good anchorage anywhere in the channel between Droke Point and the mouth of the Willapa River. Sailing vessels bar bound or anchoring over night often anchor in mid channel just inside of Leadbetter Point. Vessels anchor in mid stream off Sea Haven, South Bend and Sunshine, in the channel off Sealand a little to the st'd. of the wharf, and in Mid Channel abreast Oysterville. There is no anchorage in the Patux River for vessels of any size, the small steamers going in there lie alongside the end of the wharf at Bay Center. There are no harbor improvements in progress or contemplated.

6.

Four current observations have been taken so far as it

6.

would be necessary to anchor the vessel especially for this purpose in exposed places inconvenient for other hydrographic work.

Inside the bay and in the North channel across the bar the set of the currents is with the channels; the set of the current is diagonally across the South channel, in this channel a vessel on a flood tide is drifted towards Leadbetter Point and at the ebb time into the bay. The velocity of the tidal currents is strong at spring tides, weak at neap tides.

7.

Since the McArthur's survey in 1887 the present North channel has broken through the middle banks and these banks have grown out towards the westward and also to Id. and Ed.

The South channel has been narrowed and is now near Leadbetter Point. Changes have taken place inside Leadbetter Point, the outlines of Dog Island have changed considerably and an island has appeared on which we built our signal boat. Crescent Island and the small island to westward of it were the main land have disappeared. The outlines of Dog Island have undergone considerable change.

8.

There is no ice on the bay, occasionally there is some on the rivers during severe winters. Frostlets occur during the winter. There is more or less fog in the early fall, September and

8.

October, especially after a dry summer, but there is little fog after the first good rains come. Easterly winds in the fall drive a dense smoke out of the forests which greatly interferes with navigation.

9.

The prevailing winds are from north to northwest in summer and in winter are Southeastly and Southerly. Gales blow from the S.E., but heaviest from S.W., they do not effect anchorages in the bay and a vessel with good ground tackle should hold in any weather. Light breezes from E.S., and N.E.S., are frequent in fall and winter.

10.

A stranded vessel does not break up rapidly, in the opinion of the Captain of the life saving station, since she will bed herself in the sands. The life saving station is situated in North Cove, but one of the crew constantly patrols the beach in the vicinity of the light house when a view of the ocean can be had. The nearest hospital available for seamen is St. Mary's Hospital, in Astoria, Ore.

11.

There are no quarantine regulations, boarding stations, limit for pratique or fees.

12.

Fresh water may be obtained by vessels of light draught at

## 12.

either of the saw mills on the Willapa or Nasel Rivers. There is a good stream of fresh water piped out on an old wharf about two miles above South Bend on the Willapa, but only a very light draught vessel could reach it. Water can also be purchased from the tow boat J.H. Coleman at North Cove.

There are no regular ship chandler stores on the bay, small rope and a few miscellaneous ship articles can be obtained at the general stores in South Bend or Seashore.

Fish may always be had at South Bend, also at other places on the bay if time is given to kill. Salmon are offered for sale in season, and oysters are plentiful. Vegetables are limited in variety and quantity. Game, especially wild fowl, is plentiful in season. There is no coal to be had on the bay, all the small steamers burn wood which is purchased from the saw mills. There are no repair shops for vessels or machinery nearer than Astoria, Ore.

## 13.-

There are wharves at the following mentioned places and the depth alongside at mean low water is noted:-  
North Cove, 11 to 12 ft., at outer end.

Sea Haven, 13 ft.

South Bend mill wharf, 3 fms., at lower corner to 16 ft., at the upper corner.

## 13.

South Bend (O Fringe), 10 to 12 ft.

Beach still above South Bend (O Mill), 10 to 12 ft.

Northern wharf at proposed site of North Pacific City on Willapa River (O Pile), N.W. corner 10 ft., S.E. corner 10 ft.

Southern wharf at same place (O Rest), N.W. corner 8 ft., S.E. corner 10 ft.

Bay Centre, Palux River, 8 to 10 ft.

Sealand (O Sea), 3 fms. 5 ft., at outer end.

Sunshine, mill wharf (O Saw), abreast this equal 3 fms. 5 ft., at lower end of wharf 12 and 13 ft.

Wharf at proposed site of Stanley, Clatsal River, (O Hen), 14 to 15 ft. at head of wharf.

## 14.

There is no weather service or time ball.

## 15.

There is no branch hydrographic office or regular station for reporting results. A vessel standing in towards the beach if approaching from the S.E., will be signalled to the tug in North Cove by hoisting a flag on the southern flag staff at the light house, if approaching from the N.E. the flag is raised on the northern flag staff. This signal is made by life saving boatman on patrol. Should a vessel be expected the tug will go out to meet her, otherwise she will not unless the no-

15.

set hoists a flag, makes some signal, or lays on and off the bar some time. There is no ice code.

16.

There are no docks or marine railways.

17.

The steamer General Miles brings a few passengers on her trips from Portland. Tugs, or small steamers, ply between the railroad terminus at Sealand and various points on the bay. One runs direct from South Bend to Sealand and return daily, another, which carries the mail, goes from Willapa City via South Bend, Sea Haven, North Cove and Bay Center to Sealand and returns over the same route daily. A small tug makes daily round trips from points on the Nasel River and Duaneine to Sealand. A narrow gauge railroad, the Ilwaco and Shoalwater Bay R.R., runs up the peninsula from Ilwaco on the Columbia River (from which place communication is had with Astoria by steamer) to Sealand making two round trips daily.

There is a daily mail distributed through the bay by the steamer mentioned and a stage carries the mail daily from North Cove to Gray's Harbor and return. There is a telegraph office at Sealand. There are postoffices on the bay at Sealand, Sunshine, Oysterville, Bay Center, North Cove, Sea Haven, South Bend and Willapa City.

18.

There is no custom house or customs regulations. Captain Brown, of the life saving station, has authority to hold vessels from foreign ports and seal hatches until inspectors of customs arrive from Astoria.

19.

There are small villages at North Cove, Bruceport, Bay Center, Sunshine, Stanley, Sealand and Tahcotta, Oysterville, Sea Haven, South Bend and Willapa City; an Indian village called Georgetown near North Cove, a general store on Doge Point and a cannery on North River. North Cove is a small village spread over a good deal of area back of the wharf, there is a country store, post-office and hotel. There is a daily stage mail to and from Gray's Harbor and communication by tug with points in bay. No plan of this village could be obtained.

Bruceport is an old town and now practically dead, only a few small boats engaged in oystering visit the place and they go and come near high water. No plan of this place could be obtained, none was on file.

Bay Center is a small village lying at shore end of the wharf in the Palus River and extending back a little. It has a small country store, the inhabitants are chiefly engaged in the oyster business. No plan has ever been made of Bay Center.

Sunshine is a mill village on the Nasel River. Here the Skokomish Bay Mill Company own a saw mill, general store,

warehouses and a number of small cottages for their employees, a school-house, and sufficient wharfage for their own use. Communication is maintained with Sealand by tug boat and there is a tri-weekly mail.

Stanley had on Nov. 1, 1890, a wharf, two or three dwelling houses, a hotel and store in process of construction and a saloon. Outside communication is the same as at Dungeness. A plan of the proposed town is forwarded.

Sealand and Nakotta are practically one town, the proposed sites being separated merely by the railroad track; both places are spoken of as Sealand by people on the bay not interested. This is the bay terminus of the Ilwaco and Shoalwater Bay R.R., and has communication with points on the bay by small steamers. There are several country stores here, a restaurant and hotel. The post office is in Sealand, the depot and telegraph office in Nakotta. A plan of the proposed towns is forwarded.

Oysterville, the county seat of Pacific Co., is one of the oldest towns on the bay and, until the recent rise of South Bend, was the principal commercial place. It has a church, schoolhouse, stores and the county buildings. The inhabitants are principally engaged in the oyster business. There is stage communication twice each day with Sealand. A plan of this place is forwarded and also of Stevens addition to the town.

Sea Haven is situated on a low and marshy flat on the left

19.

bank of the Willapa, the land here is partially covered on winter tides. On Nov. 1st, 1890, there was one wharf, a frame hotel, a small building used as the Land Company's office and a printing office, a restaurant, a bank, and two or three small houses. There is a weekly newspaper published here. Outside communication kept up by small bay boat untried. Its proposed location is shown on a general plot of Willapa River forwarded, and plan is also sent.

South Bend, on the Willapa River, is the principal commercial town on the bay. On Nov. 1st, 1890, it had perhaps 1000 to 1200 inhabitants, it was gaining rapidly; a city government had been organized. Trading was in progress for a rail-road. There were two banks, a weekly newspaper, a saw mill, a dash and door mill, a church, school-house, and two hotels together with numerous stores. Its location is shown on the general plot of Willapa River forwarded. The place on this plot called North Pacific City exists only on paper and in the mind of real estate boomers.

Willapa City is an old village at the head of navigation for light draft vessels (at high water) on the Willapa.

Georgetown is a small Indian village on Government reservation near North Cove. There are a number of straggling houses between the limits marked on Sheet No. 1; during the summer time but few Indians remain here.

There is a country store on Fiske Point, there is no wharf.

19.

here, but steamers can approach the point very closely and do so when required to stop for freight or passengers. There is a small settlement at the cannery on North River.

20.

There is no reef in the bay.

21.

Custom and usage have modernized the old name Whit-a-pah (of the river) into Willapa.

Sea Haven is so written, as two words.

In addition to the above scheduled subjects I submit the following remarks in reference to certain points:-

#### Buoys.

The fairwell buoy of the South channel is good, it should be replaced. The buoys in the South channel, with the exception of No. 4, are too small, they are frequently submerged on strong tides and should be replaced by larger ones. These buoys should not be more than one mile apart. A large whistling buoy should be placed well off the North channel, both for the benefit of vessels passing for the bay and also for those passing along the coast in thick weather. The North channel should be marked by channel buoys. There should be a buoy between buoy No. 3 and Eagle Point to mark the edge of Jenny Ford Spit.

~~6/2/91~~

Another stake should be placed between stakes Nos. 3 and 5 (Willapa River Channel) and the flats on the opposite side staked out.

The numbers of the stakes in this channel should be changed to conform to law. In the southern part of the bay the buoys should be larger and more numerous, a large buoy is especially needed off Riddell Spit to replace the small red buoy No. 2, now there. The channels to Sunshine and Sealand, below Oysterville, should be buoyed at once.

A light-house of the first order should replace the present Cape Shoalwater light.

The life saving station should have modern appliances.

Very respectfully,

J. K. Riddell  
St. U.S.A., Asst. C. & G. Survey,

Loudon.
